C2 CryoBalloon™
FOCAL ABLATION SYSTEM
A better choice for patients with unwanted esophageal tissue.
The C2 CryoBalloon™ Ablation System is used to destroy unwanted tissue in the esophagus by applying extreme cold to the affected area. C2’s patented design delivers nitrous oxide (N₂O) cryogen from the diffuser through a conformable balloon, providing controlled depth of ablation and the versatility to address tortuous anatomy, advanced disease and other characteristics or conditions that would otherwise preclude ablative therapy.¹⁻³

- **No capital investment.**
  The C2 CryoBalloon Ablation System is a therapy enabled through a handheld controller in combination with self-sizing balloon catheters, without the need for large capital investment of substantial inventory of disposable items.²

- **Better for patients.**
  Cryoablation has proven to be safe²⁻⁶, have reduced potential for stricture and scarring⁶⁻⁷, and result in less post-procedural pain¹⁻⁴,⁶⁻⁸. In addition, cryoablation is often preferred by patients to alternative treatments that burn tissue.⁸

- **Successful outcomes.**
  At 10 seconds dosing, patients experienced 100 percent resolution of their disease.⁶
