

BLOMDAHL USA

Medical Ear Piercing

Safe, sanitary ear piercing

Our medical ear piercing is developed entirely upon what is known as “modern aseptic technique” within the health care industry. This means that all our products and methods are safely designed to avoid the spreading of infections during piercing. The sterile method guarantees that the piercing is hygienic and safe.

Blomdahl piercing earrings are not like ordinary earrings. They are specially designed to facilitate the healing and so that you can easily change to regular earrings after the healing period.

- ✓ **Optimal Healing:** When air can circulate around a new piercing, it will heal better. That’s why the earring backs on Blomdahl piercing earrings are always fixed at the tip of the post.
- ✓ **Airy with longer posts:** To be kept airy, it’s important that the piercing earring has the right length. For slightly thicker earlobes Blomdahl has piercing earrings with extra long posts.
- ✓ **Safer to change earrings:** Blomdahl’s piercing earrings have been designed so that the holes will be slightly wider in the beginning and thereby not get so easily damaged when you change earrings.

Medical Plastic

Blomdahl’s Medical Plastic is the only ear piercing earring in the world with 0% nickel! This eliminates the risk of developing a nickel allergy. Medical Plastic is recommended for anyone who wants to avoid developing a nickel allergy, or for anyone that already has a nickel sensitivity.

Medical Grade Titanium

Medical Grade Titanium is the safest of all metals because it binds what little nickel there is extremely well. In other words, little or no nickel is released into the skin and underlying tissue. Medical Grade Titanium is accepted extremely well by the body and is therefore used more and more in implants and other medical applications, often replacing stainless (surgical) steel.

Medical Plastic with Swarovski Crystals

All earrings are sold by the box of 5 pairs

Medical Plastic Crystal
12-0103-01, 4mm
\$68 per box

Medical Plastic Rose
12-0103-03, 4mm

*Mini style requires a mini gun. This style is recommended for the upper ear, not for infants

Piercing aftercare for your patients!

Our swabs encourage proper post-piercing care, cleanses the piercing, and simple to use

Piercing Aftercare Swabs

13-10

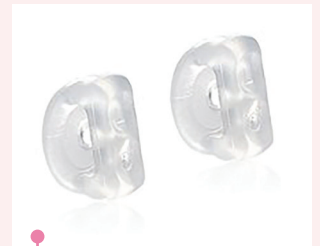

\$48 per carton (16 boxes)

Patient Cost: \$8 per box of 24

- ✓ Blomdahl Piercing Aftercare contains sodium chloride solution and is skin friendly.
- ✓ During a more extended period of use, the cleansing swab is kind to the skin compared to other classical/traditional cleansing products, which can dry out the skin and sting.
- ✓ Blomdahl Piercing Aftercare enables the mechanical cleansing between the earring back / jewelry part and ear where bacteria and dirt normally can accumulate.

How to prevent earring backs from falling off

- 1 To ensure a positive ear piercing experience, the final procedure is important.
- 2 When you have pressed the trigger, hold the instrument absolutely still for 2-3 seconds.
- 3 Then lift your thumb from the trigger.
- 4 Next, release the clamping pin which is held with your two forefingers.
- 5 Gently lower the instrument down and away from the ear lobe.
- 6 Rushing this final part of the ear piercing procedure is the most common reason for backs coming off. Should a patient lose a back before the 6-8 week healing period is over, give them a new back. **We have ear piercing backs available in a pack of 25 for \$5.** In case of an emergency, remove a back from an unused cassette.
